

PHY 117 HS2023

Week 6, Lecture 1

Oct. 24th, 2023

Prof. Ben Kilminster

To avoid confusion, we have 4 Ks:

K = Kelvin

k = Boltzmann constant

K = kinetic energy

κ = coefficient of thermal conductivity

Thermodynamics - study of temperature, heat, and the exchange of energy.
(mechanical work)

Macroscopic scale: measurable properties:
volume, pressure, temperature.
↓
force/area

Marriott's bottle:

Visually:

before heating

during heating

after heating

box (5 closed sides)

piston pushing 6th open side

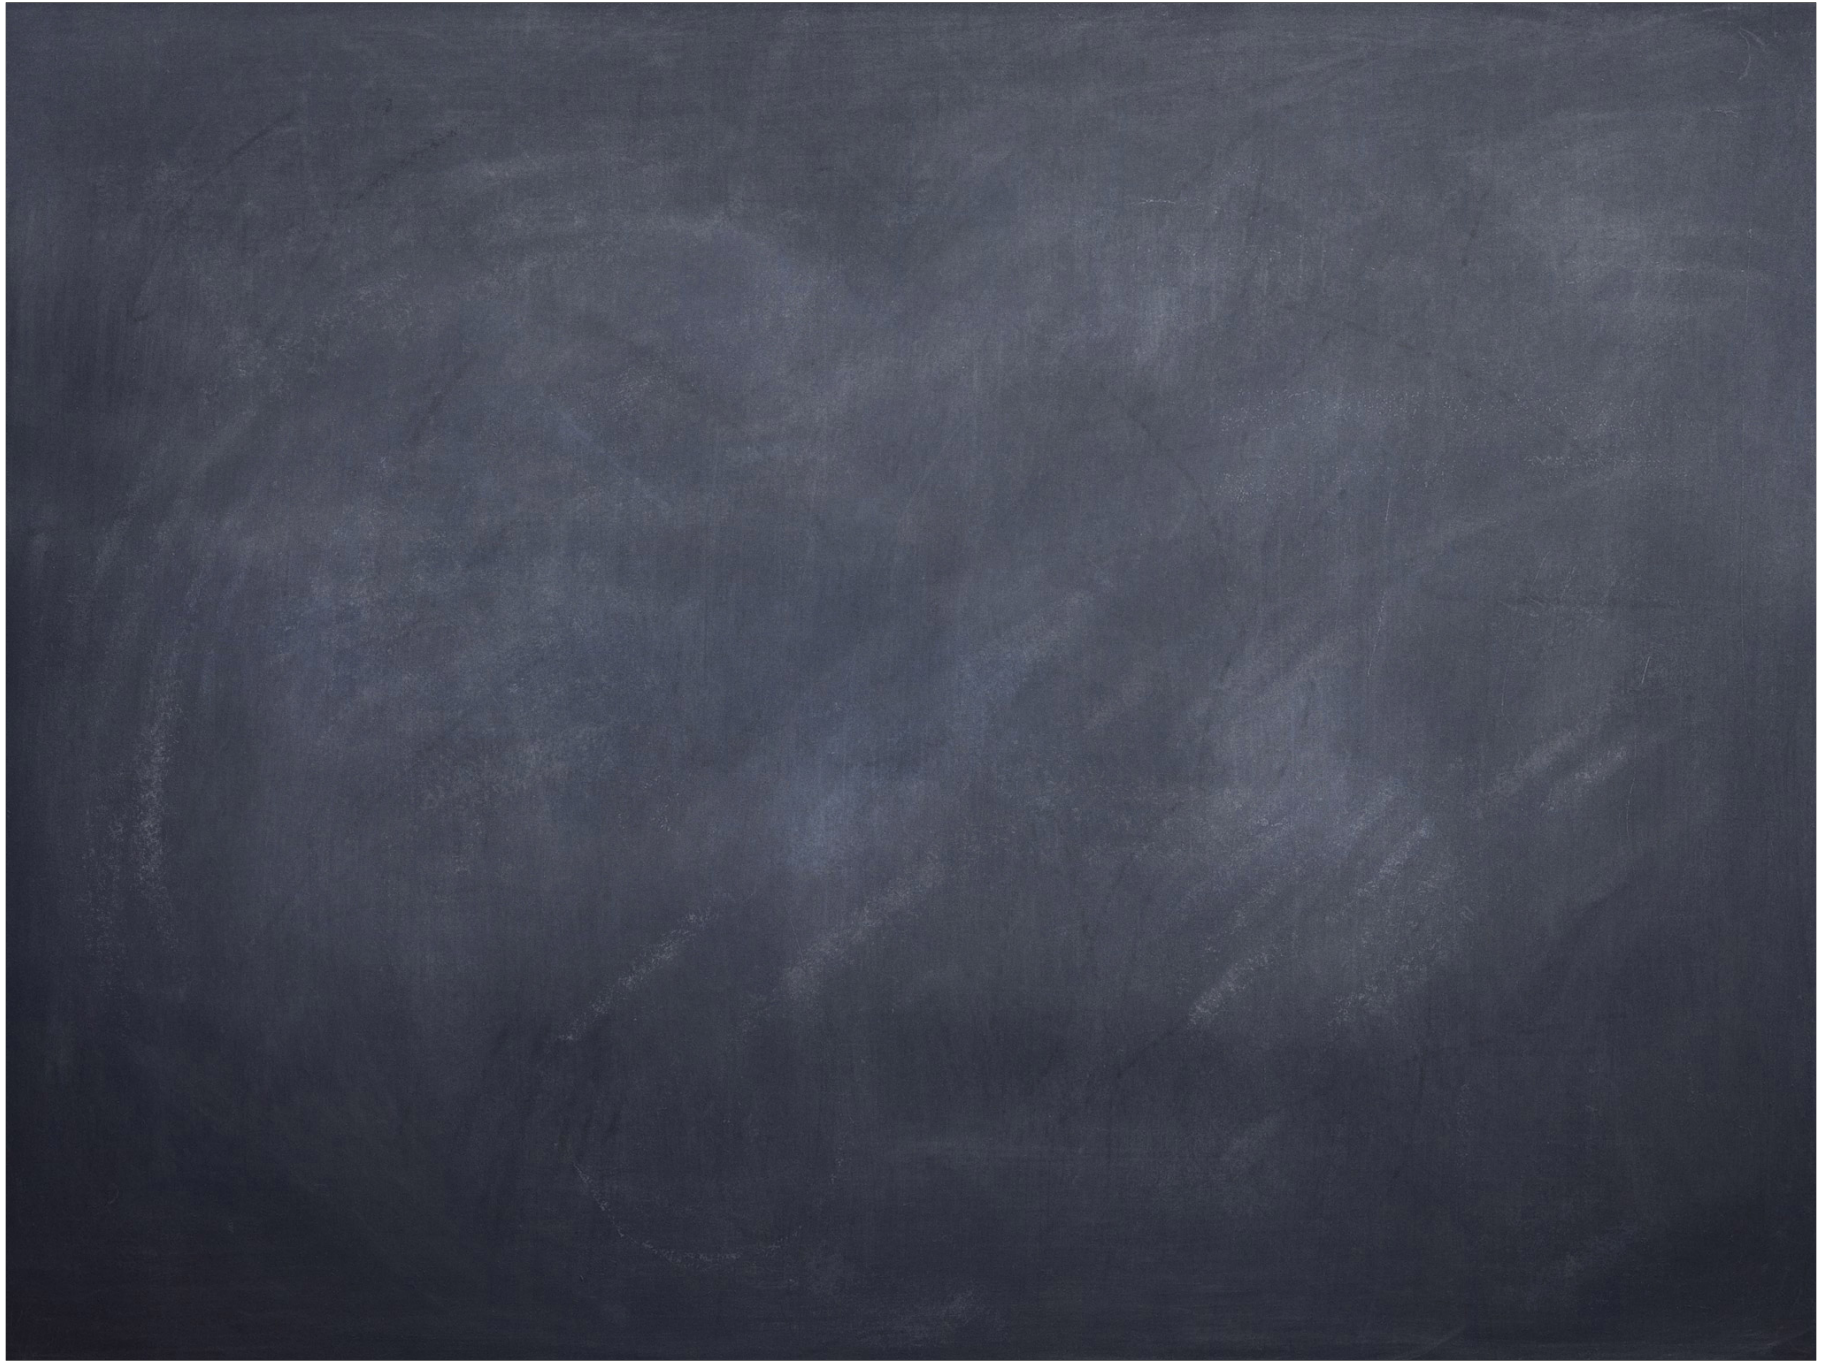

gas of molecules

(a) The distribution is asymmetric.

(b) For different temperatures.

Figure 17.4: Maxwell-Boltzmann distribution for oxygen gas O_2 with atomic weight ~ 16 per atom.

② → ③ :

③ → ④ :

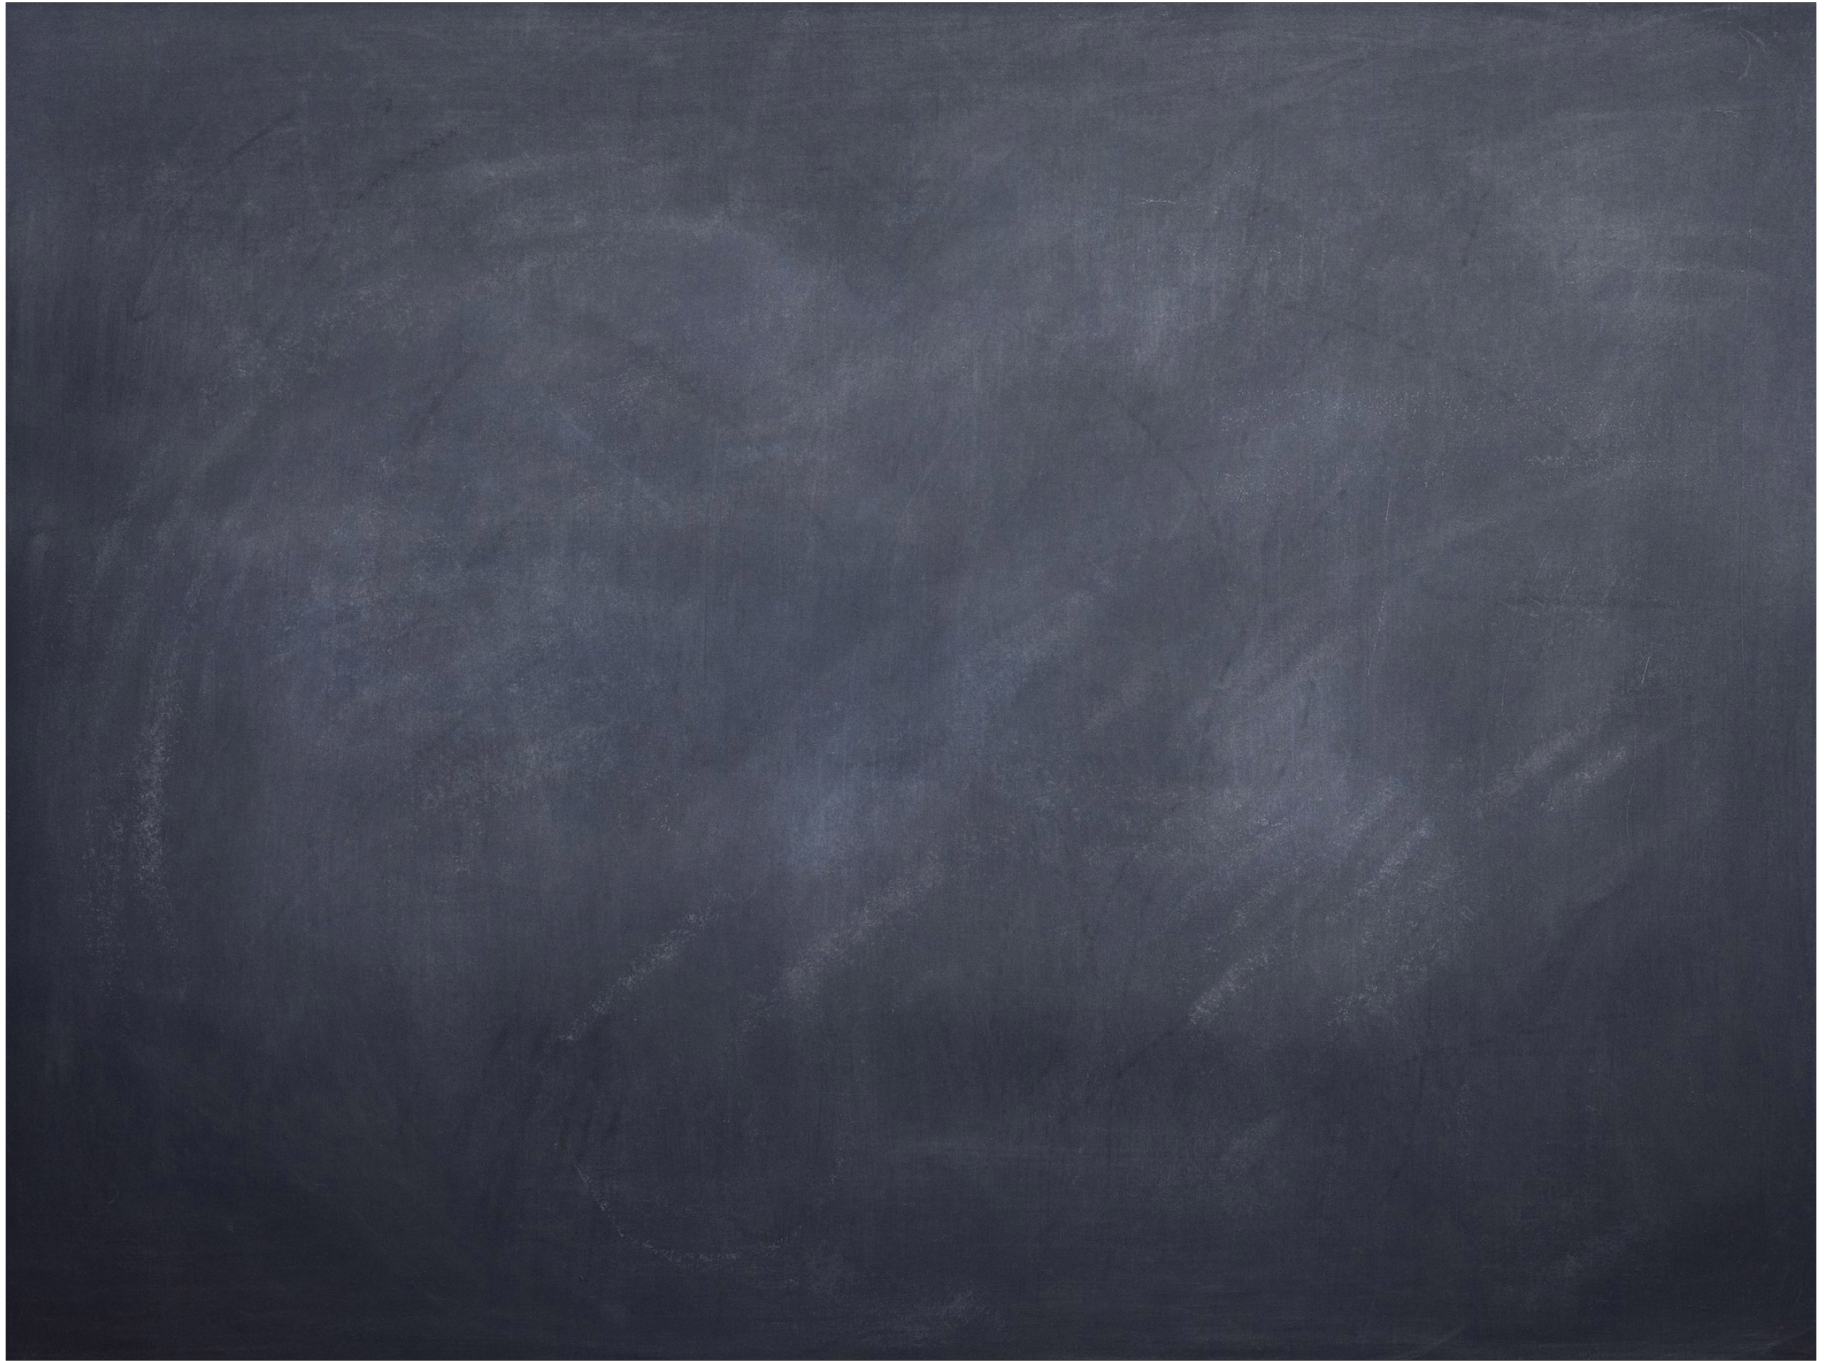

for example:

heat
gas

Can we use torque to increase temperature?

F_g : tension string

5 kg

$$F_g = Mg$$
